About the Library

AstDyn (Asteroid Dynamics) is a high-fidelity C++ library designed for the precise orbit determination and propagation of celestial bodies, specifically focusing on Main Belt asteroids and Near-Earth Objects (NEOs).

Developed within the **ITALOccult project**, this software represents the state-of-the-art in computational astrodynamics, aimed at reducing ephemeris uncertainties to sub-milliarcsecond levels for accurate stellar occultation predictions.

Key Features:

- **Rigorous Dynamics**: Relativistic models (EIH) & JPL DE441 perturbations.
- **High-Order Integration**: Adaptive Runge-Kutta-Fehlberg 7/8 (RKF78).
- **Precision**: Validated against NASA/JPL Horizons ($\pm$2m accuracy).
- **Comprehensive Tools**: From coordinate transformations (IAU 2006) to differential correction.

This manual serves as the definitive reference for researchers, astronomers, and software engineers.
